1. Business Problem & Objectives

Leheriya currently manages Shopify, Amazon and Myntra through separate, disconnected systems. Inventory synchronization is largely manual, which can result in overselling, duplicate orders, incorrect inventory, slow order processing, slow label generation, separate vendor communication, and limited return-label capability. The new OMS centralizes these workflows into one platform.

Primary Objectives

- Centralize Shopify, Amazon and Myntra orders
- Maintain one internal Master SKU per product variant
- Map each marketplace SKU to the Master SKU
- Maintain centralized inventory
- Prevent overselling during simultaneous orders
- Support physical and virtual warehouse logic
- Generate/manage shipping labels and AWBs
- Track shipments
- Handle returns, RTO and NDR
- Maintain an immutable audit trail
- Provide operational dashboards
- Support payment/return reconciliation
- Be multi-tenant and SaaS-ready from Day 1
- Allow additional merchants/channels without redesigning the core

2. OMS Guru — Reference Modules

OMS Guru is used as the functional benchmark — not as the scope. Leheriya's own OMS Guru account has these main modules already in daily use; the new OMS matches this level of functionality where relevant, then extends it with Leheriya's own business rules.

Dashboard

Shipping, new orders, return issues, problem invoices, sales graph, top-selling SKUs.

Inventory

Managed / Unmapped / Unmanaged / Failed / Unlisted Products views, per-channel stock and sync mode.

Channel

Marketplace/channel connections — connect, configure, and manage Shopify, Amazon, Myntra and other channels.

Reports

Sales, order, and business performance reporting.

Platform Admin (SaaS layer)

Tenant list, tenant details, platform users, integration health, system jobs.

Multi-User Login

Per-user permission toggles — POS, offline orders, reports, inventory, order processing, returns, purchase/expense.

Orders

Unfulfillable / New / Packed / Ready to Ship / Cancelled / All Orders tabs, with sync, pack, and batch actions.

Purchase

Purchase order and vendor procurement workflow.

Company

Business profile, GST number, contact details, address, multi-user login management.

Settings

Courier mappings, payment method mapping, order sync options, general configuration.

Subscriptions (SaaS layer)

Add-on features sold separately, each billed per month — the model for Leheriya's own future SaaS plans.

Import / FAQ / Tickets

Bulk data import and standard customer-support utilities.

3. Gap Analysis Summary

OMS Guru already covers a large part of Leheriya's requirement — multi-channel inventory, multiple warehouses, orders, shipping labels, returns, and vendor/WMS basics are standard, documented capability. The genuine gaps are narrower and specific to Leheriya's own workflow.

● Confirmed Custom Requirements

Not standard OMS Guru capability — genuine custom development.

1. Order → specific vendor → that vendor's own Telegram group, automatically
2. Vendor-specific (not generic) group order notifications
3. Existing Shopify order-management + vendor-dispatch workflow carried into the new OMS
4. Label cancellation → order reverts to Unfulfilled → Shopify reflects it
5. Simple, Excel-style data entry for vendors who aren't tech-comfortable
6. Bulk tracking update — select multiple orders shipped in one parcel and update tracking for all at once
7. Auto-reconciliation from uploaded Amazon/Myntra payment files

● Needs Verification / Custom Build

Related capability exists in OMS Guru — exact rule needs to be built to Leheriya's specification.

1. Virtual Warehouse stock visible on Shopify only, never Amazon/Myntra
2. Offline Warehouse stock visible on all three channels
3. Shopify order edits syncing into the OMS immediately
4. Return-label generation, exactly as Leheriya's workflow needs it
5. Exact channel-specific shipping/courier behavior
6. RBAC and Subscription/SaaS-ready architecture for Leheriya's own future product

● Already Covered — Not a Development Gap

Standard, documented OMS Guru capability.

1. Shopify, Amazon, Myntra connections
2. Multi-channel inventory synchronization
3. Multiple warehouses
4. Order management
5. Shipping label generation, bulk labels
6. Returns processing
7. Vendor / WMS basics, purchase orders

4. Final Complete Module List

The modules below are what actually gets built. **GST Invoice** is added here as its own module — it was flagged as missing from the earlier draft.

Module	What It Covers
1 Authentication	Secure login, role-based access, session management, refresh tokens, password reset. Core
2 Tenant / Merchant Mgmt	Platform-level merchant onboarding and isolation — Leheriya is the first tenant on a SaaS-ready architecture. Core
3 Dashboard	Operational overview — new/processing/shipped orders, low stock, pending fulfilment, shipments, returns, RTO/NDR, sales. Core
4 Products	Product creation, variants, images, pricing, GST/HSN, marketplace-specific data. Core
5 Master SKU	One unique internal SKU per sellable variant — the identity used by orders, inventory, warehouses, vendors and shipping. Core
6 SKU Mapping	Master SKU → Shopify/Amazon/Myntra SKU mapping, with sync status and error tracking. Core
7 Inventory	Physical + Virtual warehouse stock, reservations, immutable stock ledger, overselling protection. Core
8 Warehouses	WH-001 (Physical/Offline, shared across all channels) and WH-002 (Virtual, Shopify-only) — explicit location mapping. Core
9 Orders	Centralized orders from all channels, one Master Order per channel order, Shopify edits sync immediately. Includes an All Orders tab alongside the status-wise tabs. Core
10 Fulfilment	Stock-available → warehouse pack & ship; stock-unavailable → vendor routing. Core
11 Vendors	Vendor login, restricted access, assigned orders, accept/reject, dispatch status, vendor-specific Telegram group routing, simple Excel-style entry, bulk tracking update. Core
12 Shipping	AWB, label generation/download/cancellation, manifests, tracking; label cancellation reverts Shopify to Unfulfilled. Core
13 Returns	Return request, approval, return label, pickup, QC, refund/exchange, restock. Core
14 RTO	Return-to-origin tracking, receipt, QC, restock or reject. Core
15 NDR	Failed delivery reason, attempt tracking, reattempt scheduling, escalation. Core
16 Notifications	Configurable events (order, vendor, shipment, return, low stock), each individually switchable on/off, across Telegram, Email, WhatsApp where supported. Core
17 GST Invoice	Invoice generation, HSN/GST mapping, tax calculation, PDF preview, download/print, email delivery where supported. Added
18 Settings	Company details, channel connections (self-service), courier settings, tax/GST, API credentials. Core
19 Users & Roles	RBAC foundation — Super Admin (full control) and Vendor (restricted) at launch, architecture ready for more roles later. Core
20 Audit Logs	User, action, timestamp, and before/after values for every material system action. Core
21 Integration Management	Connection health, last sync status, failed jobs, webhook failures, retry actions — across Shopify, Amazon and Myntra. Core
22 Payment Reconciliation	Amazon/Myntra payment files can be uploaded directly; the system automatically flags which orders' payment or return hasn't come through yet. Finance
23 Returns/Refunds Reconciliation	Matches refunds and return-driven adjustments against expected values, flags mismatches. Finance

5. Newly Confirmed Business Rules

These specific rules were confirmed in discussion and are now part of the locked scope.

Partially Paid Orders → Treated as COD

An order marked "Partially Paid" is handled the same way as Cash on Delivery for fulfilment and reconciliation purposes.

Cancelled → Unfulfilled Again Returns to New Orders

If an order is cancelled and then marked unfulfilled again, it moves back into the New Orders queue rather than sitting in a separate/lost state.

All Orders Tab

Alongside the status-wise tabs (New, Packed, Ready to Ship, Cancelled, etc.), there is a combined **All Orders** tab showing every order regardless of status.

Configurable Notifications

Each notification type can be individually turned on or off — not an all-or-nothing switch.

Vendor-Friendly, Excel-Style Entry

Many vendors are not very tech-comfortable. Their panel is built as a simple, spreadsheet-like form — familiar fields, minimal clicks — rather than a complex dashboard.

Bulk Tracking Update for Vendors

A vendor shipping several orders in a single parcel can select all of them at once and update tracking information for the whole group in one action, instead of updating each order individually.

Automatic Payment/Return Reconciliation

Amazon and Myntra payment files can be uploaded directly into the OMS. The system automatically identifies which orders' payment or return has not come through, instead of manual cross-checking.

6. Design Principle — Kept Simple

The UI is built to be as simple as possible on purpose — clear forms, minimal steps, no unnecessary complexity — since the people using it day-to-day (including vendors) are not all equally tech-comfortable. Functionality is prioritized over decoration.

7. Architecture — SaaS & RBAC Ready

The system is built multi-tenant and RBAC-ready from Day 1 — not added later. Leheriya-specific business rules are configuration, not hard-coded application logic, so the same core engine can eventually onboard additional merchants without a redesign. Leheriya itself will act as the first live "test customer" — the system is built and tested against Leheriya's real day-to-day operations before being considered ready for anyone else to subscribe to.

Roles at launch: Super Admin (full control of every module) and Vendor (restricted to their own assigned orders). The permission model underneath is granular and role-based, so additional roles can be added later without rebuilding the system.

If launched to market as a SaaS product: support/maintenance charges and terms for that separate business will be discussed and agreed independently, once the platform is ready to onboard outside customers.

8. Hosting, Performance & Branding

Item	Detail
Domain / Brand Name	OMSKing — domain already purchased by the client; the product is built and branded under this name
Logo	To be shared/finalized by the client
Hosting	Hostinger VPS (cloud-based server), already available with the client — included for the first year
Backend	Node.js — chosen specifically to keep performance fast and avoid the speed issues experienced with the previous system
Performance Commitment	Speed is treated as a first-class requirement, not an afterthought — the cloud VPS + Node.js combination is specifically to prevent a repeat of previous slowness

9. Code Ownership & Handover

- Code is version-controlled on GitHub from day one of development — not just at the end
- Login access to the GitHub account is shared with the client for full visibility throughout the build
- The complete codebase and database are handed over to the client before the final payment is released

10. Additional Confirmed Workflow Rules

These detailed workflow rules were confirmed as annotations on the working proposal and are now locked into scope.

New Tenant Onboarding — Bulk Product Import

When a new tenant is created, the system provides an option to import all existing products channel-wise (Shopify, then Myntra, then Amazon). Products carrying the same SKU across channels are mapped to each other automatically during this import.

New Product Mapping Decision Flow

When a new product is added on any channel, the system checks whether a product with the same identity already exists on any other connected channel. If found, it is mapped to that existing product automatically. If not found, it is placed under "Unmapped Listings," from where the user can either create it as a brand-new product or manually map it to an existing product by entering the Master SKU.

Order Fulfilment — Offline vs. Virtual Line Items

When a new order comes in: line items available in the Offline warehouse are prepared for direct shipment; line items only available in the Virtual warehouse are posted to the relevant vendor. Inventory is reduced across all connected channels, with the option to do this automatically or trigger it manually. A shipping label can then be generated, moving the order into the "Ready to Ship" tab, with an option to generate the courier pickup request.

Payment & Return Reconciliation Logic

Shopify: Paid and Cancelled orders are excluded automatically. If an order's fulfilment status is "Fulfilled" but its payment status is still "Unpaid," and the order is old enough to be flagged, it means payment (or RTO) hasn't been received yet — these orders surface in the Reconciliation tab for review.

Amazon / Myntra: Their payment files can be uploaded directly; matched orders are marked "Payment Received." Return files can be uploaded the same way; matched orders are marked "Return Received."

Channel-Specific Courier Ownership

Amazon and Myntra orders generate labels through their own respective couriers. Shopify orders use Leheriya's own courier accounts, consistent with the existing Shopify shipping setup.

Payment Mode Sync

The following payment modes are synced and recognized across the system: **COD**, **Prepaid**, **Partially Paid** (treated as COD, per the rule confirmed earlier), and **Void**.

Restock Destination on Returns / RTO

When a returned or RTO'd item is restocked, the user can choose exactly where it goes back into: **All channels**, **Shopify (Offline warehouse)** specifically, **Amazon**, **Myntra**, or **None** (for items that can't be resold, e.g. damaged on return).

Dashboard — Status Tabs

The centralized dashboard is organized by order status tabs: **New Orders**, **Processing Orders**, **Pending Orders**, **Dispatched Orders**, and **Delivered Orders** — giving a quick operational read without needing to open the full order list.

11. Commercial Terms & Timeline

Total Project Cost	₹80,000
Maintenance	Free for 1 year (Leheriya only, unless a new module is added)
Hosting	1 year included (Hostinger VPS)
Code & Database Handover	Before final payment
Start Date	Immediately upon agreement
Target Completion	Approximately 3 months, with full testing on Leheriya's live operations before considering it complete
Initial Channels	Shopify, Amazon, Myntra — architecture supports adding more channels later
TOTAL PROJECT COST	₹80,000

Where a specific requirement cannot be implemented exactly as envisioned because of a genuine third-party API limitation or similar technical constraint, this will be raised for discussion so an alternative approach can be agreed — rather than the requirement being silently dropped.

Payment Milestones

Payment is released stage-by-stage as development milestones are completed and reviewed — not as a single lump sum.

Payment Stage	Amount	Payment Timing
Project Start	₹5,000	Before development starts
UI / Design Complete	₹10,000	After the complete UI/UX design is reviewed and approved
Backend + Database Core	₹20,000	After core backend and database architecture is complete
API / Channel Integration	₹15,000	After Shopify, Amazon and Myntra integration is complete
Business Workflow Completion	₹15,000	After inventory, vendor, fulfilment and shipping workflows are complete
Final Testing & Delivery	₹15,000	After final testing on live operations, code + database handover
TOTAL	₹80,000	

Development Timeline — Approximately 3 Months

Phase	Development Work	Estimated Time
Phase 1	Complete UI / Design	2 Weeks
Phase 2	Backend & Database	3 Weeks
Phase 3	API & Channel Integration (Shopify, Amazon, Myntra)	3 Weeks
Phase 4	Business Workflow (Inventory, Vendors, Fulfilment, Shipping)	2–3 Weeks
Phase 5	Testing, Optimization & Final Delivery — tested live on Leheriya's own operations	2 Weeks
Total		Approximately 3 Months

The timeline may vary depending on API access, credentials, third-party documentation, API limitations and external service response times — outside the developer's direct control.

12. Developer Contact & Support

Developer Name	Momtaj Husen
Developer Email	momtajlife@gmail.com
Developer Phone	+977 981 575 9505
Alternate Contact	98158 47227 (friend — if primary number is unreachable)
Code Repository	GitHub — access shared with client from Day 1
Support Window	Free for 1 year post-launch (Leheriya only, excluding new-module requests)

All project communication, milestone updates, and support requests during development and the 1-year free maintenance window go through the above contact details.
